

1. Main Menu

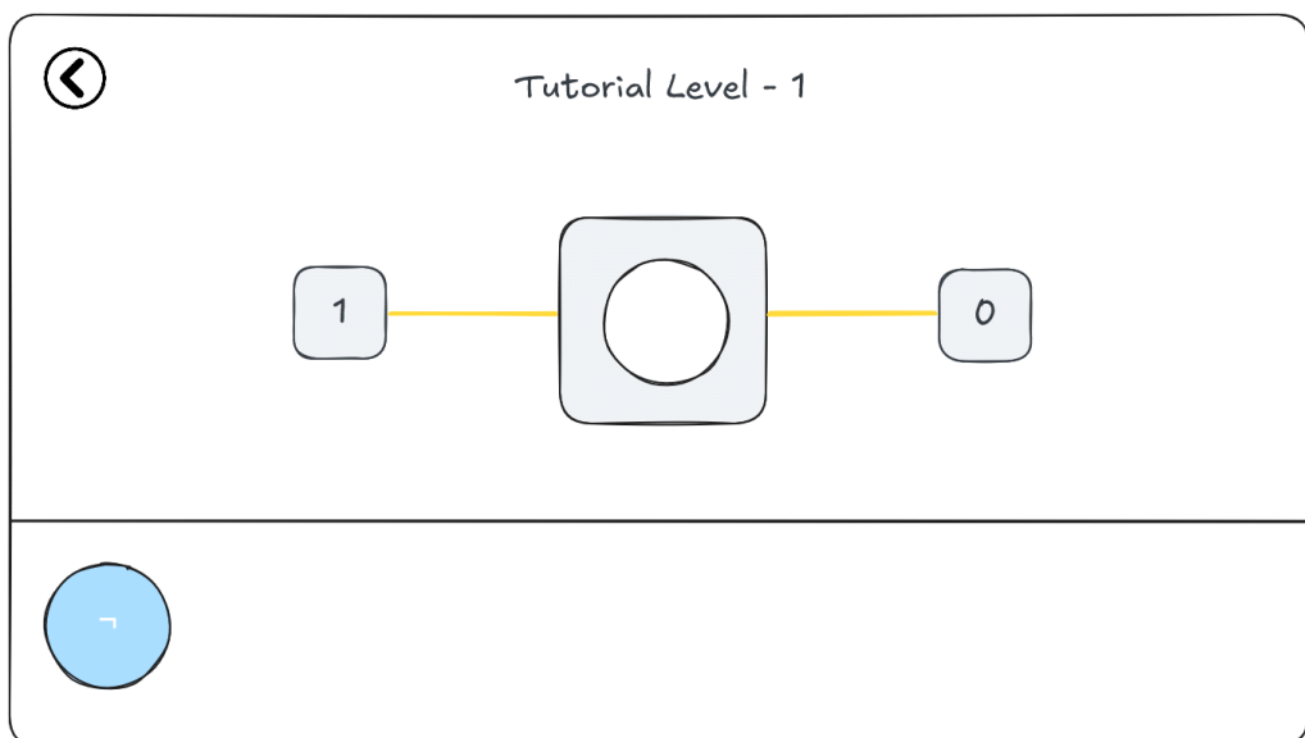

- If Level 1 is still not completed, then show "Start" - otherwise show "Continue"
- Clicking on "Start" will start the intro to the game, while clicking on "Continue" will make the player jump to the Level Selection
- If we scrap the idea of having the option for languages, then "Settings" could become "Volume" where the slider would be directly shown.

2. Level Selection

- 2 different designs for the locked levels:
 - a lock-icon for the entire square (this is used normally), or
 - the number of the level is still displayed with a small lock-icon on the bottom-right.
- Back button goes back to the Main Menu
- Decided to leave out the "Settings" button, because it feels unnecessary - the player can just go back to the Main Menu to adjust the volume (and/or language).

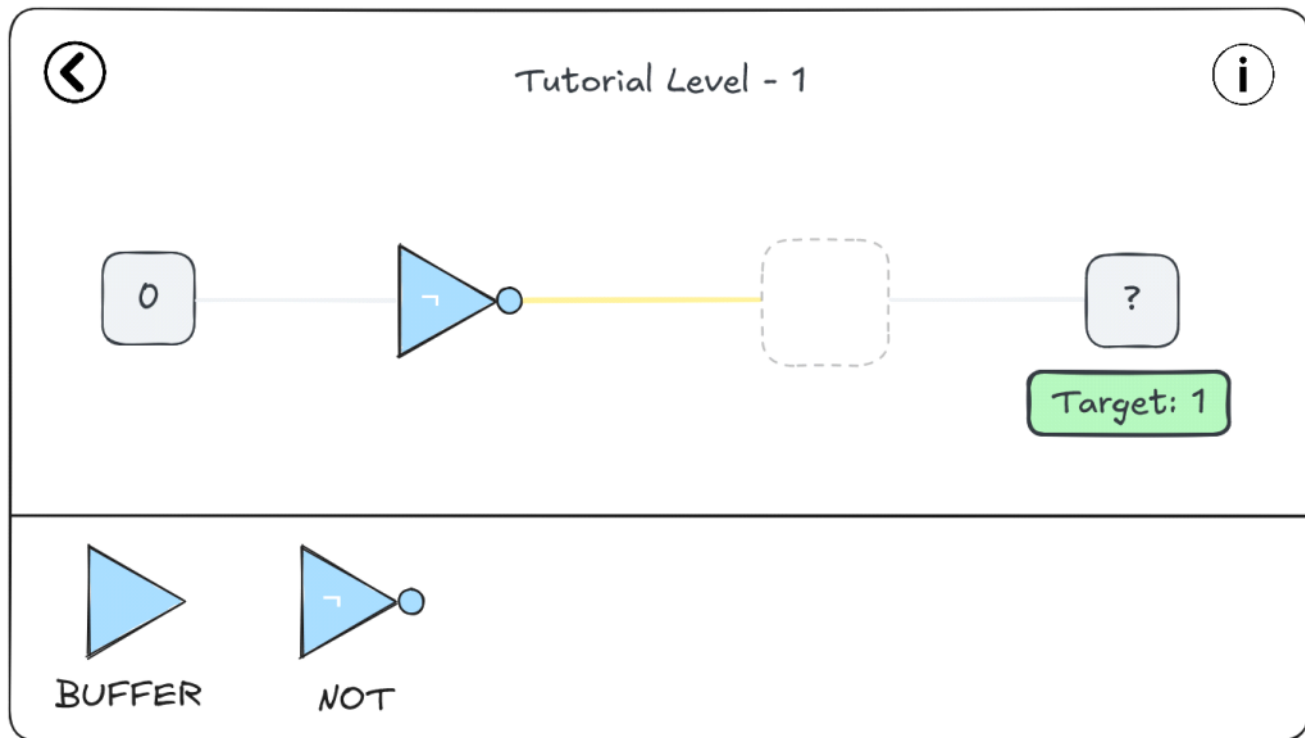

3.0 Level 1 (scrapped version)

- Rather use the typical forms of the logical gates (triangle with dot for NOT, etc.)

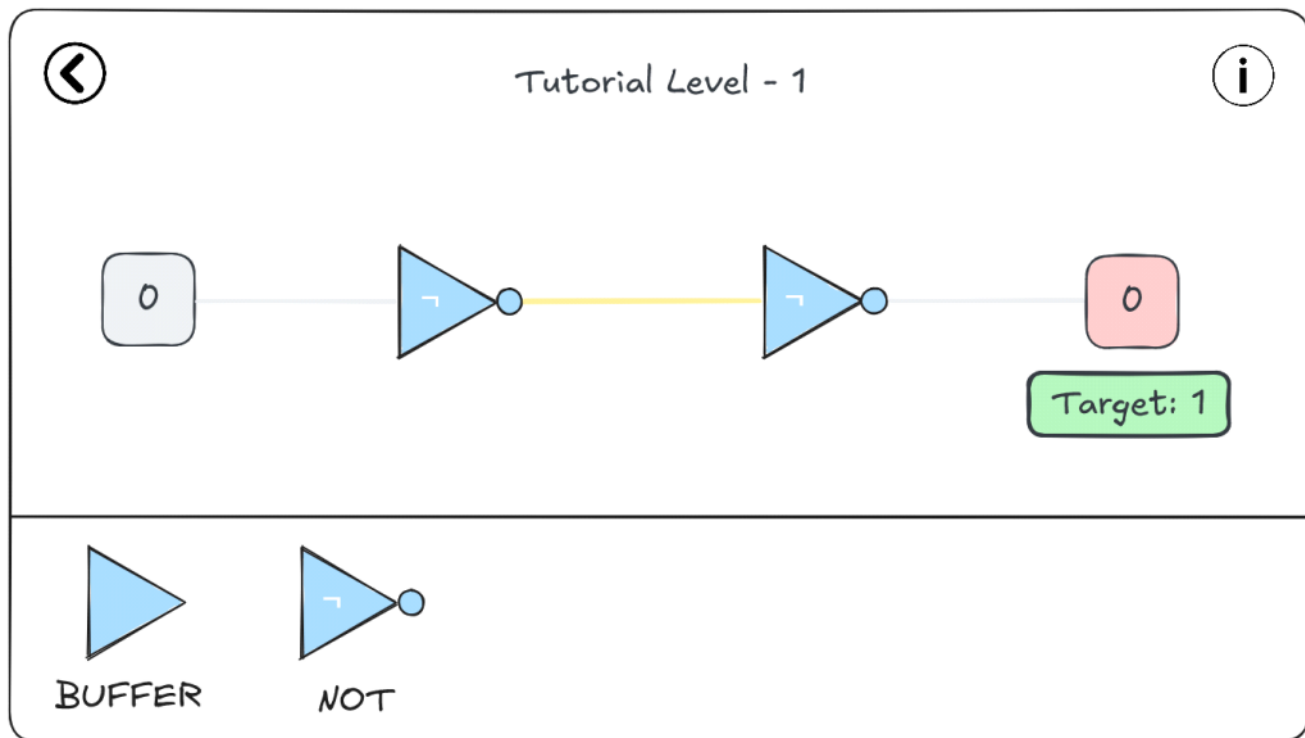

- Better: use different colors for wires (signal 0, signal 1, and undefined signal)

3.1 Level 1 (unsolved level)

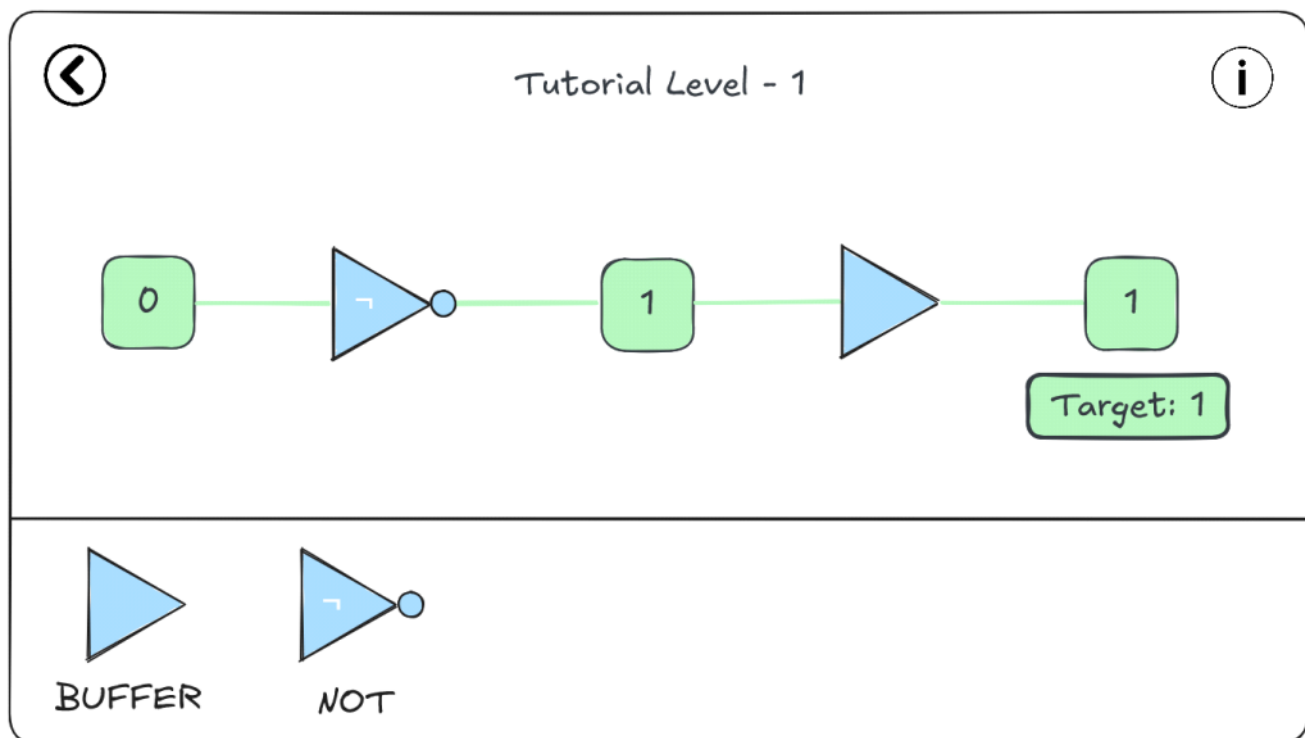

- Dashed-Box with lower opacity to show the player where he can drop a logic gate
- Yellow wires and squares for when signal is 1
- Grey wires and squares for when signal is 0
- Red wires for when signal is unknowns. A "?" symbolizes an unknown state
- Target remains static no matter what the player does
- Info-icon on the top-right for reopening the intro Popup.

3.2 Level 1 (wrong solution)

- If wrong solution: output-box in red
- We need the Buffer logic gate, because otherwise a gate with only 1 input will ALWAYS be a NOT gate (since all other gates have 2 inputs) -> no-brainer for the player -> bad design.
- Green wires if successful for 3 seconds

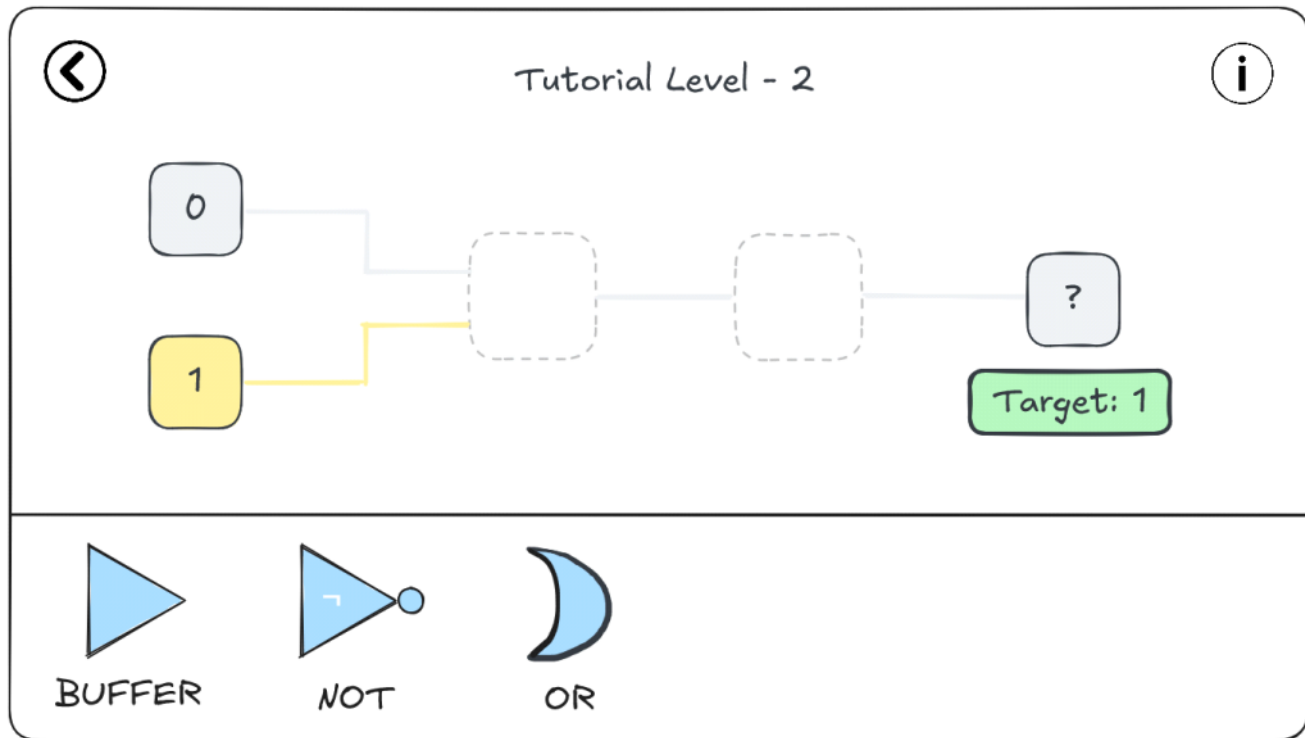

3.3 Level 1 (solved solution)

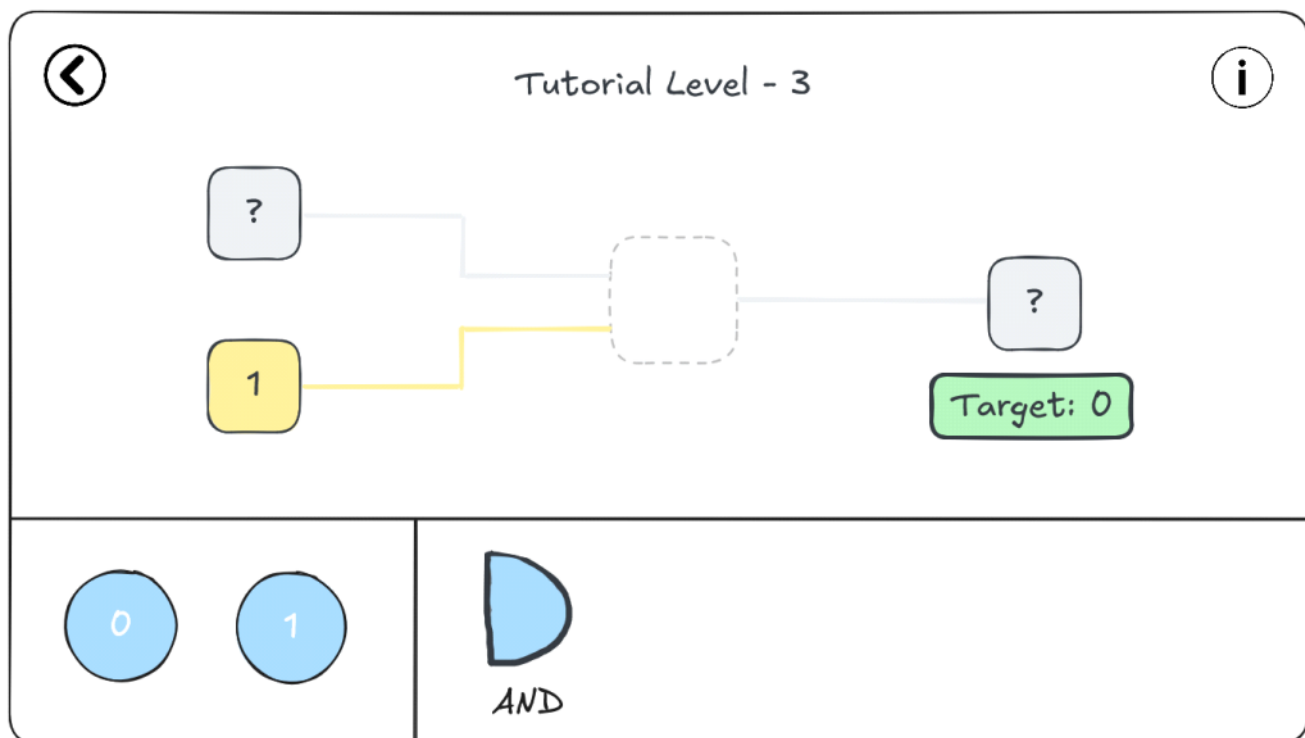

- Yellow wire for signal 1
- Once a logic gate has been placed in a designated spot, then the dashed-box disappears

- Once level has been correctly solved, each square and line is colored green, and then the after-level-popup appears.

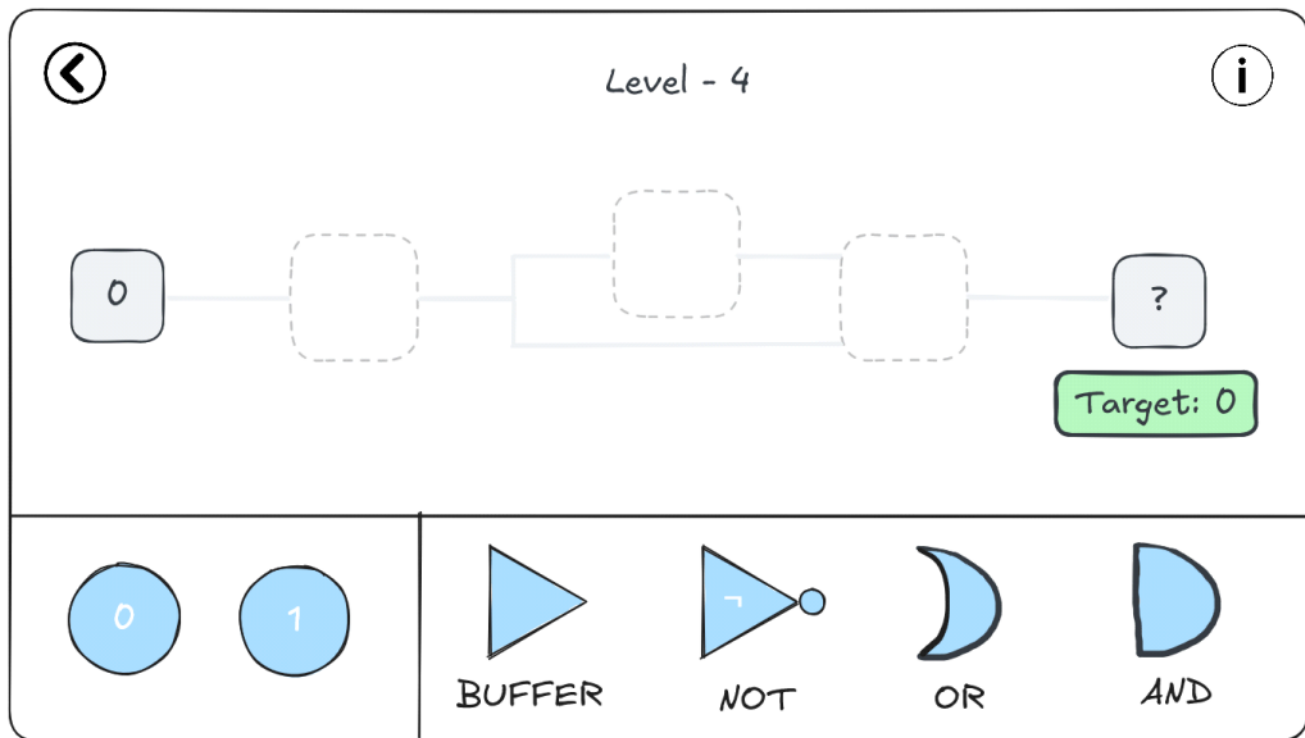

3.4 Level 2

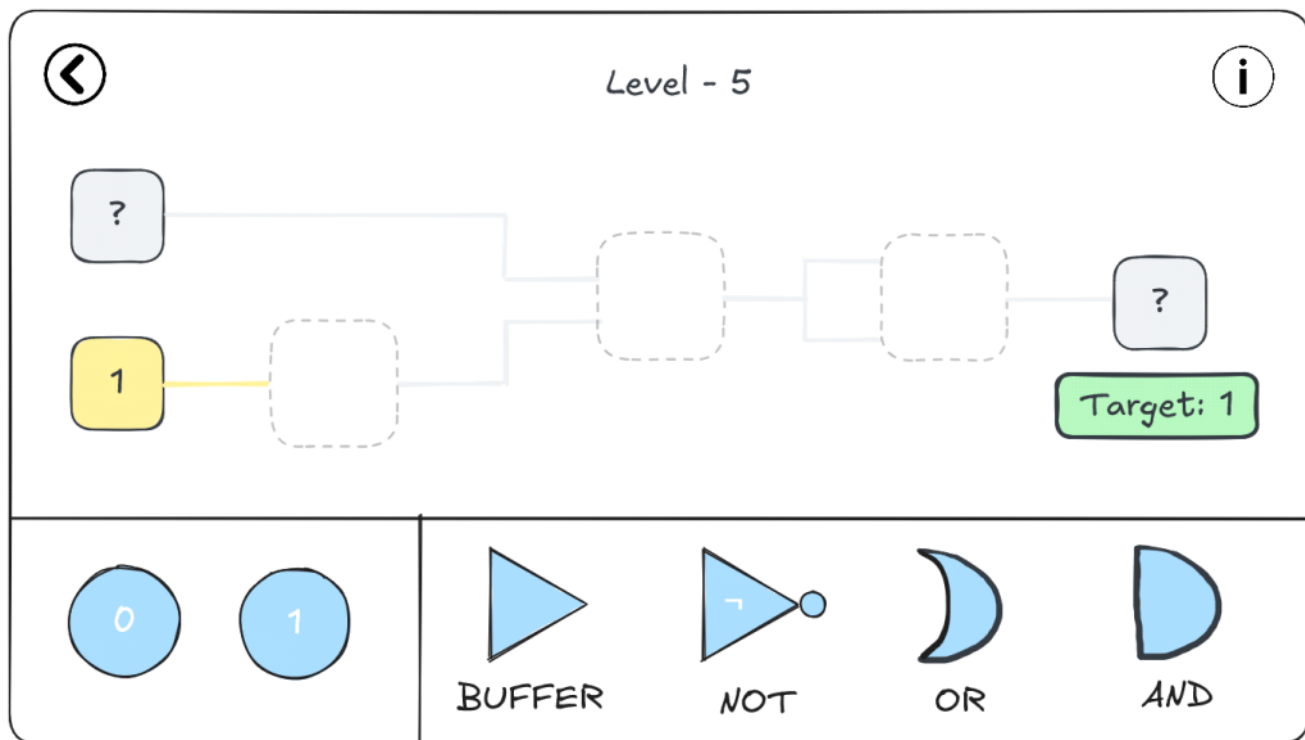

3.5 Level 3

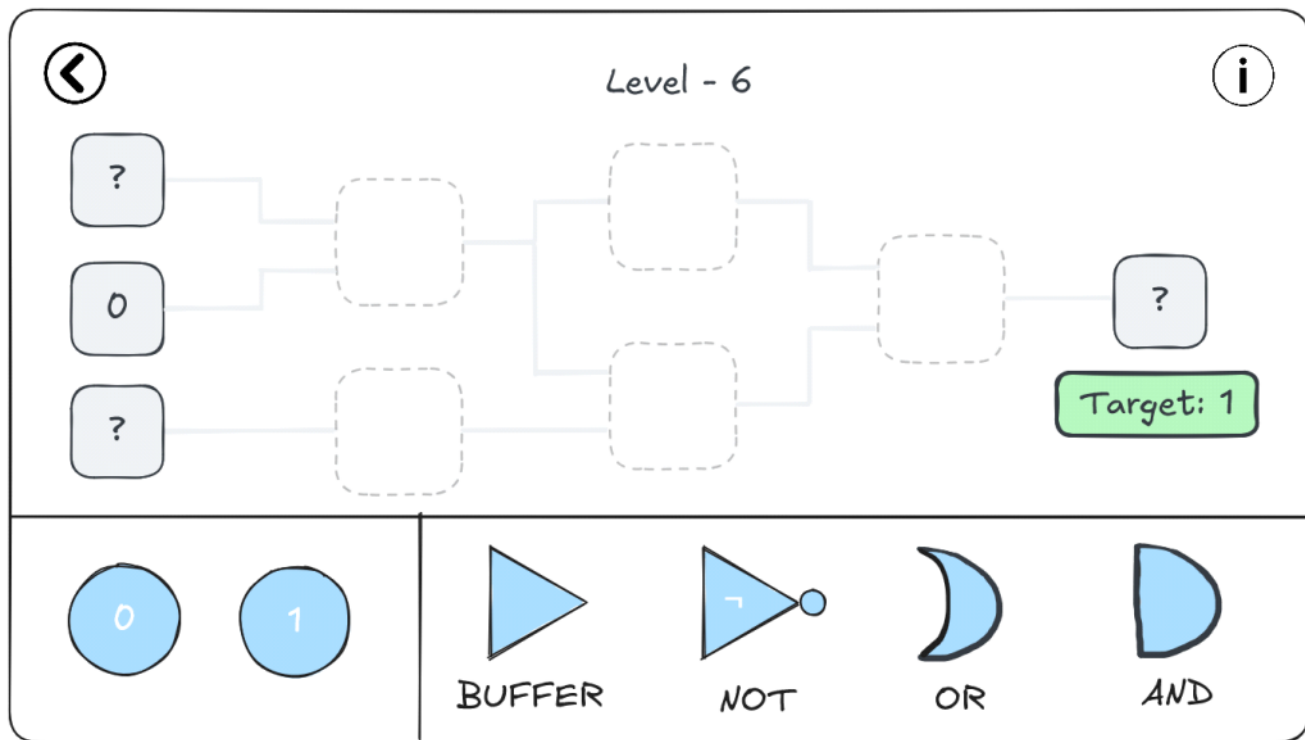

3.6 Level 4

3.7 Level 5

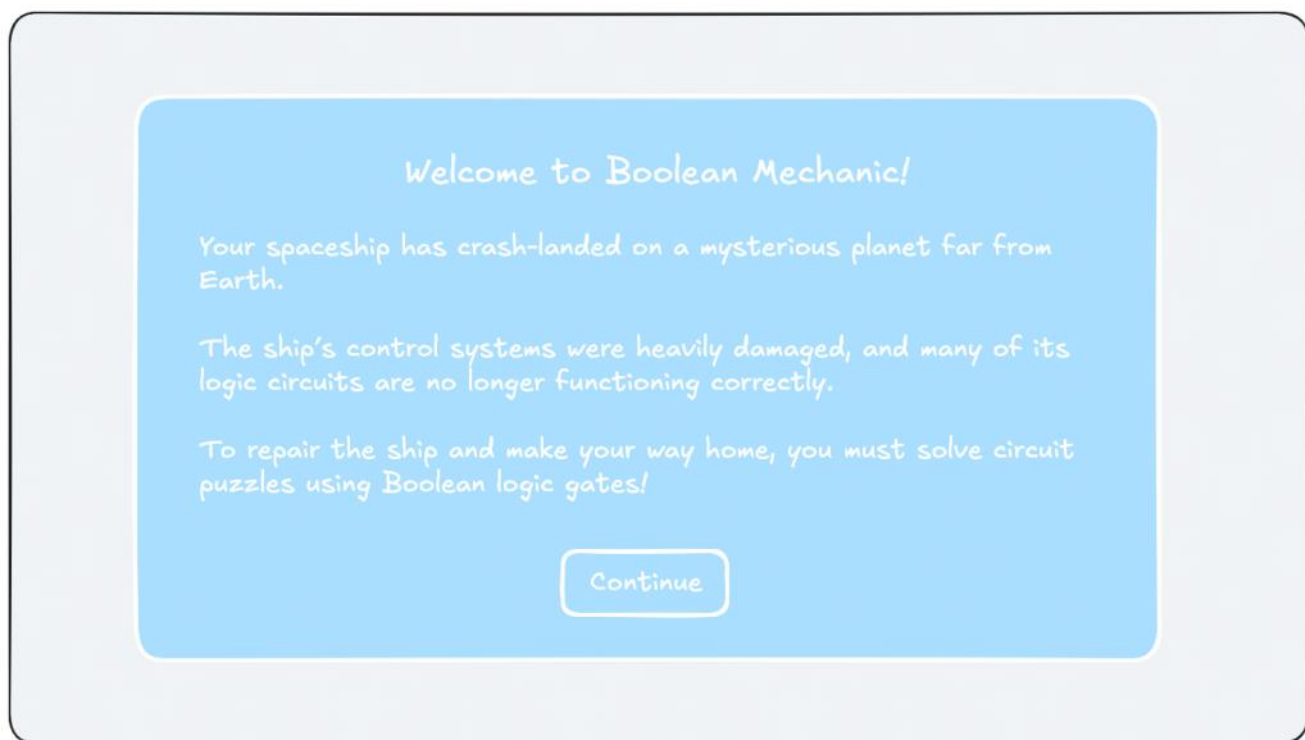

3.8 Level 6

4.1 Tutorial Popup for Level 1

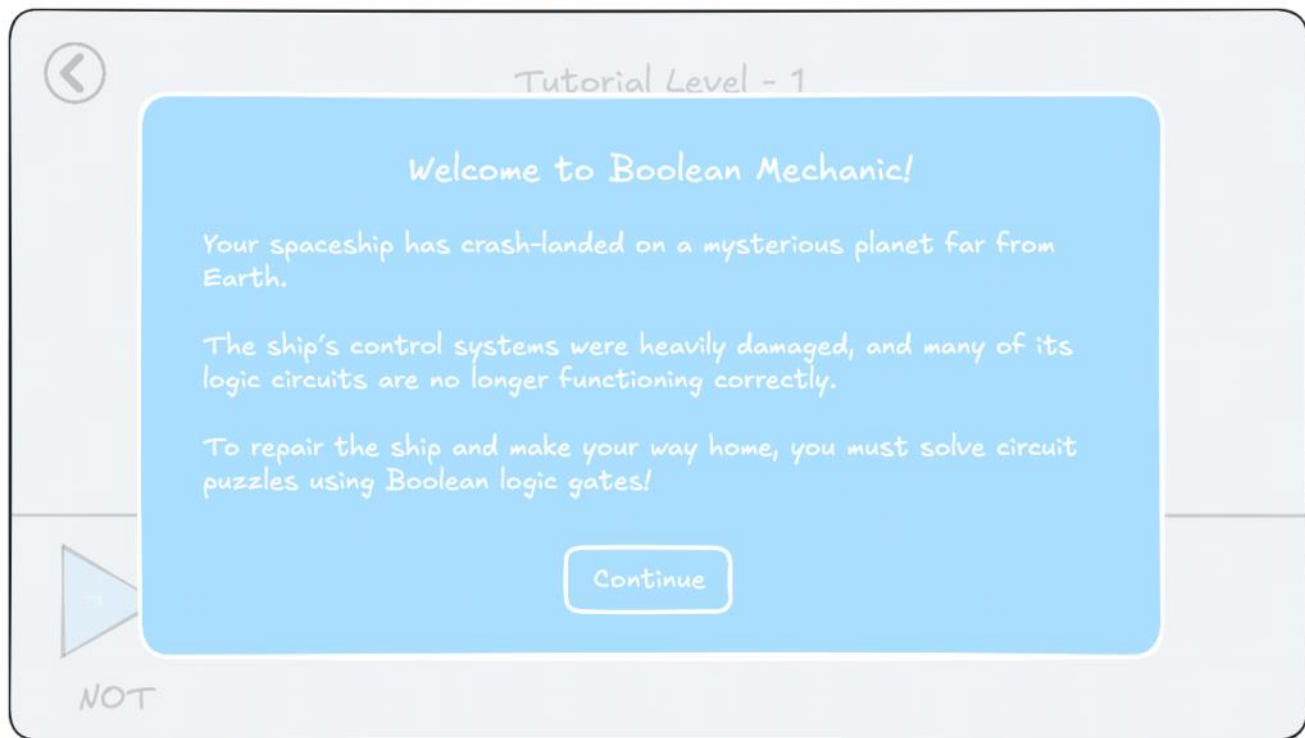

(We decided to NOT go with this design! Please use the design below in 4.2!)

- Appears directly after the intro is over
- Small intro to the story as text

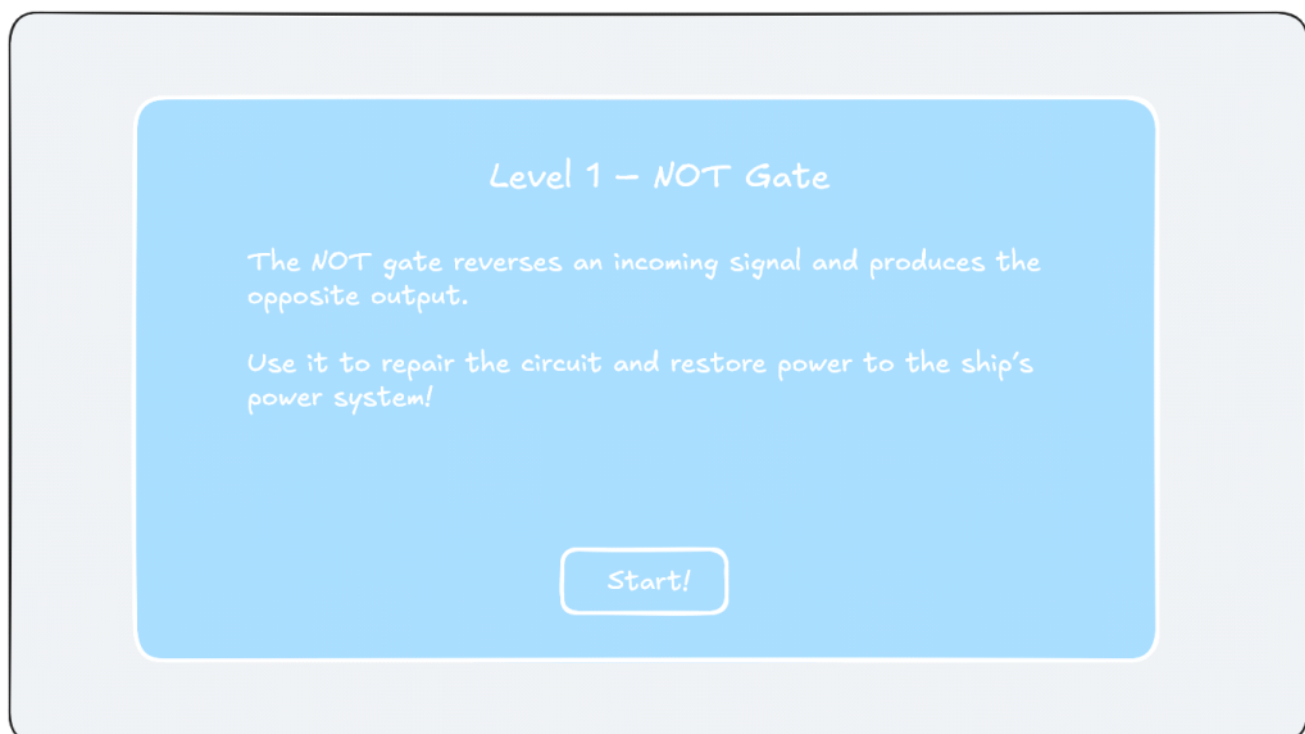

4.2 Tutorial Popup for Level 1 with Game as Background with lower opacity

(We decided to go with this design!)

- Could look good. Our devs can try it and compare it to the previous version and decide which one works better

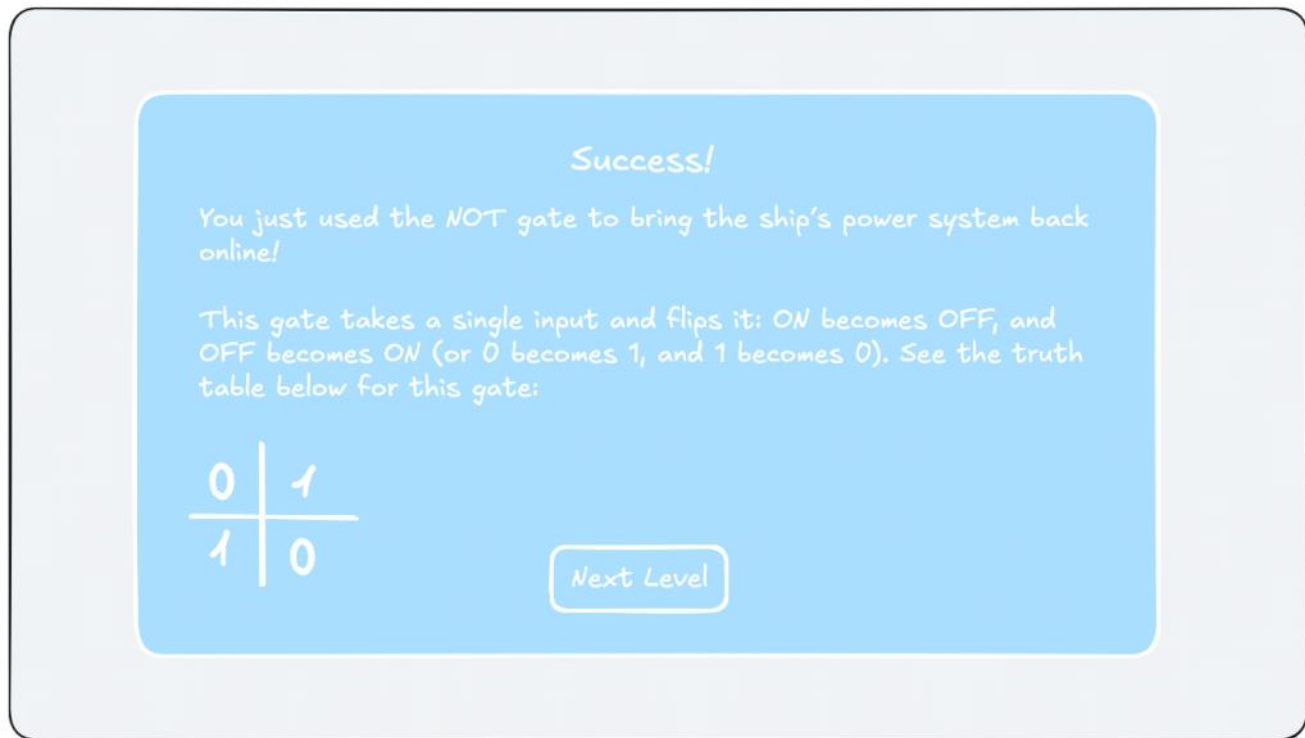

4.3 Tutorial Popup for Level 1 - Second Part

- After clicking "Start!", the player can start playing the level.
- Some ideas for the parts of the ship that have to be repaired:
 - Power System
 - Main Door
 - Lights

- Oxygen Distribution System
- Navigation System
- Main Computer
- Engines
- Engine Cooling System

4.4 Tutorial Popup for Level 1 - After Level Completion

- Small text regarding the story of the game (part "x" has been repaired)
- Followed by a more detailed explanation of the logic gate just learned, including its truth table
- Clicking on "Next Level" should either navigate to the Level Selection screen, or directly jump to the next level.
- Show boxes with images of the spaceship parts, and fill in/put a check on the level that was just completed

5. Game-Intro

Comic style, 3 screens.

- Screen 1:
 - Image idea: Spaceship traveling through space with Earth clearly visible in the distance. Everything looks stable and normal. Calm, hopeful tone.
 - Text idea:
 - Ship AI: "Course locked: Earth. No anomalies detected."
- Screen 2:
 - Image idea: Inside ship, alarms triggering, UI glitching and lights flickering.
 - Text idea:
 - Ship AI: "WARNING: CRITICAL SYSTEM FAILURE DETECTED!"
- Screen 3:

- Image idea: Ship crashed on a mysterious alien planet. Broken hull, smoke, strange landscape (rocks, glowing elements, alien sky). The ship is clearly stranded far from Earth.
- Text idea:
 - Ship AI: "systems... offline..."
